ABSTRACT

ANNIELYN A. ALICANTE and DANICA M. DUJALE of Central Philippines State University - Victorias Campus. August 2024. Supply Chain Analysis of Vegetable Vendors in Victorias City

Adviser: George P. Gumawa Jr., MPA

Supply chain is a system that connects the producer to the end consumer which involves the acquisition of vegetables, delivery, storage, and selling. The insufficiency in the number of supply chain and its produce may result to supply and demand disequilibrium. The study was grounded on Pfeffer and Salancik's (1978) resource dependence theory, analyzing how organizations rely on necessary resources from other organizations for the supplies. This study aimed to determine the extent of supply chain of vegetable vendors in Victorias City in terms of geographical location in Canlaon, San Carlos, Valladolid, and Cagayan and Iloilo. Quantitative descriptive-comparative design was used, and purposive sampling was employed to identify participants who met the specified criteria. A self-made validated 10 item questionnaire was utilized in this study. The result of the study showed that the supply chain of vegetable vendors was from Canlaon which implies that most of the vegetable vendors always obtain their supply of vegetables such as baguio beans, squash, bitter melon, cabbage, bell pepper, eggplant, radish, spring onion, cucumber, and hot pepper in Canlaon as it provides quality and sufficient supplies. The study found out that there was a significant difference in the supply chain in Valladolid, and Cagayan and Iloilo in terms of sex as male vegetable vendors influences the procurement of vegetable supplies due to physical demands. A significant difference in the supply chain when grouped according to monthly profit,

specifically, Canlaon with a significant difference of Php5,000 and below suggesting that the majority of vegetable vendors has a small scale operation; San Carlos with a significant difference of Php10,000-15,000 suggesting that vegetable vendors carefully review their strategies to earn profit; a supply chain both from Valladolid, and Cagayan and Iloilo with a significant difference of Php20,000 and above indicating that they achieved the highest profits due to their large-scale vegetable selling operations and adequate capital. In accordance with this viewpoint, the researchers developed a training program in developing the technical skills of the agricultural farmers in vegetable sector to be proposed in the locality to implement and execute the technical plan provided to boost the agriculture sector in the locale and can aid to minimize carbon footprints and supply chain inefficiency of which the vegetable vendors can easily access to the nearest supply chain and therefore lowering the price.
