Readiness of Teacher Education Students in Online Teaching and Learning Management.

Adviser: Ms. Meldy S. Lubrico

This study investigates the readiness of teacher education students for online teaching across key competency areas: online teaching course design, digital communication, basic computer skills, advanced computer skills, and the use of learning management systems (LMS). Data from 138 respondents were analyzed through surveys, focusing on socio-demographic profiles and self-assessed readiness levels. Statistical analyses, including means, standard deviations, and non-parametric tests, were employed to explore significant differences based on respondents' profiles.

The findings reveal that teacher education students generally exhibit a high level of readiness for online teaching and associated competencies. Across all assessed areas—online teaching course design, digital communication, basic and advanced computer skills, and LMS usage—respondents reported high readiness levels. Specifically, they demonstrated strong comfort with digital communication tools, proficiency in basic and advanced computer skills, and familiarity with LMS platforms. Areas identified for improvement include responsiveness to communication requests and proficiency in specific advanced computer skills like file encryption.

Significant differences based on demographic factors were observed. Gender disparities were evident in basic computer skills, with females showing higher proficiency.

Age also influenced LMS usage readiness, with older students demonstrating greater familiarity. Year level played a role, with senior students generally exhibiting higher readiness in online teaching course design and LMS usage compared to juniors.

To enhance readiness for online teaching among teacher education students, educational institutions should focus on several strategic recommendations. Targeted training programs should address areas of lower readiness, such as responsiveness to communication and specific advanced computer skills. Integrating online learning activities with real-world applications can significantly enhance engagement and relevance in teaching practices. Additional support and resources are needed to improve proficiency in digital communication tools. Curriculum enhancements that integrate digital literacy and online teaching competencies are crucial to ensure comprehensive preparation for future educators. Implementing continuous assessment practices and providing constructive feedback will further support students in enhancing their digital skills and readiness for effective online teaching.

These initiatives collectively aim to prepare teacher education students to excel in online teaching environments, fostering better learning outcomes and increased student engagement in digital education. By addressing these recommendations, educational institutions can better equip teacher education students with the necessary skills and competencies to navigate and thrive in the evolving landscape of digital education.
