## **EXECUTIVE SUMMARY**

In addition and subtraction are the basic math operations that people use in their everyday life. Sometimes though it is inevitable that people commit mistake or miss calculation especially if bigger and larger numbers to be counted are involved. In a store or retail outlets that were commonly seen in the country needs only a calculator or logbook for computation but for business or organization that is growing like BBB Foundation Inc. needs a more systematic and organized calculation of their supplies and inventories. That is when an Automated Inventory System takes places.

BBB Foundation Inc. is an organization that gives medical help by providing free medicines donated by the different NGO's and individuals to selected beneficiaries all throughout the District 3 area. As for now the foundation get widely known as by the number of the beneficiaries filling up to avail the said medical help. The BBB in order to accommodate the growing numbers of their beneficiaries also increase their number of medicine supply by making a daily transactions of medicines distribution to heighten and some problems to occur.

The researchers studied the history, the operations and the inventories of BBB Foundation Inc. in order to come up with the methods of monitoring the supplies coming in and out of the foundation. In this study the researcher's set their objectives on how to put an end to the problems encountered in their daily operations. They gather some local and foreign articles to help them come-up with ideas to achieve their objectives. These where discussed in the end chapter of this research in which strongly provided by information and it will show how Automated System can lessen manual works and error occurrence through the accurate result of the automated version. To explain this further, tables and diagrams were shown in chapter 4.

The improvements and advantages of the automated system are also discussed, As well as the Technical Requirements and Classifications. To help the en-sure of the automated system made by the researchers, at the end of this research book is a User Guide that will help them know the basic manipulation of the system. This study helped the researcher's to develop their society as well as the end users.
